EDUCATION

UC San Diego

Bachelor of Science in Mathematics and Computer Science, Cum Laude

San Diego, California

Aug 2015 — Jun 2019

EXPERIENCE

Founding Engineer

Nevoja

Aug 2024 — Present

San Francisco, CA

- Founding engineer for an AI-native logistics management platform for an EV trucking fleet; built core product and infrastructure across FastAPI, React, Postgres, and AWS ECS
- Established the initial engineering foundation, including authentication, database migrations, CI/CD, deployment infrastructure, and core dispatch domain models; authored 35% of all commits across the app
- Built a multi-agent runtime on AWS Bedrock AgentCore, enabling first-party AI agents and human-operated connectors to safely share logistics workflows through a dual-auth MCP tool layer
- Replaced HERE Tour Planning with an in-house dispatch optimization engine using Google OR-Tools CP-SAT, modeling driver shifts as a VRP with time windows, hours-of-service constraints, shift-duration bounds, and load prioritization tailored to real fleet operations
- Migrated Samsara geofence processing from long-running ECS workers to SQS-triggered Lambda, retiring 1,300 lines of worker code and improving retry isolation with partial-batch failure handling
- Built Gemini-powered rate confirmation parsing that extracted stops, locations, and appointment times from uploaded PDFs, using geocoding and fuzzy matching to deduplicate operational data
- Modeled non-load driver activity — maintenance, trailer repositioning, yard reports — as a first-class operational tracking domain, reusing dispatch stop and leg semantics while avoiding brittle model inheritance

Senior Software Engineer

Benchling

Aug 2020 — Aug 2024

San Francisco, CA

- Technical lead for a 6-person platform team, owning roadmap planning, architecture design, and execution across domain modeling and notebook infrastructure initiatives
- Led implementation of Domain Graph, a company-wide platform for defining, documenting, and generating external-facing product models, aligning engineering teams around domain-driven design
- Built tooling to generate internal and external REST and GraphQL APIs from Domain Graph definitions, saving an estimated 6+ months of engineering effort on a major product initiative
- Architected a large-scale Postgres migration and backfill across 11B rows using Celery distributed jobs, completing the migration without disrupting production workflows
- Integrated a new WebSocket architecture for real-time notebook collaboration, enabling new product verticals and supporting 200k+ users with up to 50 concurrent collaborators in a document
- Redesigned notebook spreadsheet evaluation and caching, reducing P90 load times from up to 3 minutes to under 1 second

Software Engineer

Uber

Jul 2019 — Aug 2020

San Francisco, CA

- Implemented a financial ledger service for \$1B+ in Uber Cash balances using Kafka, Cassandra, and Docstore, improving reliability and transaction performance
- Built a migration service that moved millions of users to the new ledger with zero downtime and no user-facing impact
- Designed a reporting service that compiled daily transaction data across legacy and new ledgers for partner banks, unblocking \$106M in revenue

TECHNICAL SKILLS

- **Languages:** Python, TypeScript, JavaScript, SQL/Postgres, Go, Java, C++
- **Backend/Data:** FastAPI, SQLAlchemy, GraphQL, Celery, OR-Tools, PyTorch
- **Infrastructure:** AWS ECS, Lambda, SQS, Bedrock, Docker, Terraform, Datadog, Sentry
- **Frontend:** React
- **Interests:** Coffee Roasting, Running
